

Smart Security Solutions in Autonomous Security | PISIQ

What are Smart Security Solutions?

[“Smart security system”](#) may sound like an oxymoron to many. If you’re thinking that nearly all current home and office security systems are already “smart”, you’re right—to a degree. The intelligence of security systems comes from the fact that they’re usually connected to a network of some sort.

The first electronic security systems were connected through phone lines, but because these as land lines became less common, (not to mention they could be cut or tampered with), certain

companies started connecting main alarm panels through other means, such as cellular or Wi-Fi (with a cellular backup, just in case the first method was compromised). Also, if you have a door, window, or glass sensor installed as part of your security system, all of those things connect wirelessly to your alarm panel, typically with a proprietary radio protocol. If you are paying for a monitoring service, this system connects your building with a system monitoring company and first responders in case of emergency. So, in a traditional sense, these systems already exist.

But because technology is evolving, and criminals are becoming more sophisticated, companies are looking for new and innovative ways to stay ahead of the game. Because technology is evolving, and criminals are becoming more sophisticated, companies are looking for new and innovative ways to stay ahead of the game and [PISIQ](#) allows for this to be implemented on a large scale.
